Most webmasters are not technical wizards, and it is well known in that circle that without a good control panel, their host's web server is practically useless. Control panels simplify and automate the administration of many complex tasks performed on a web server. The control panel industry is dominated by four names, with cPanel being by far the most well-known.

So, what exactly is cPanel?

cPanel began as a software company. Since its inception in 1977 to provide web hosting automation software, it has largely set the standard for providing a simple yet robust user-friendly control panel to administer the intrinsic and complex task of web servers. The software that the company provides is also known as cPanel.

A cPanel web hosting account is a hosting account that includes a control panel that runs the cPanel software. The popularity of this software among webmasters and web hosts is largely due to its user-friendly powerful interface with a plethora of powerful tools for performing essential functions quickly, easily, and reliably. Webmasters, both new and experienced, prefer this control panel because it provides an easy-to-use interface for managing their site. As a result, they have the control they desire. The incorporation of video tutorials and on-screen assistance improves usability. If you've never used cPanel or uploaded a website before, the included Getting Started Wizards will get you up and running in no time.

The cPanel interface is very user-friendly, and it includes video tutorials and on-screen help if you get stuck. This enables hosting customers to manage their own accounts without contacting your support staff. If you don't know what you're doing or don't want to mess things up, the Getting Started Wizards will automatically set things up correctly the first time. As a website owner, you benefit from security features such as password-protected sections of your website. If you had someone work on your site, you can deactivate their passwords once they no longer need access. Other advanced features, such as hotlink protection and blocking of problematic IP addresses, are also useful. The integrated third-party application "Fantastico" that allows users to quickly and automatically enhance their site by incorporating a wide collection of useful add-on applications is an added benefit of a cPanel account.

For those interested in starting a web hosting business, cPanel provides the server version of the software, the WHM (Web Host Manager). Server administrators can use VHM to automate server management tasks. Again, simplicity at work: fill in a couple of fields with the necessary information and click "create," and a new account is created in less than a minute. A Getting Started Wizards section is also included for those who require it. The fact that WHM is self-monitoring is one of the features that make it popular among administrators. For example, if the software detects a failed service, it will attempt to restart it automatically. Furthermore, the software is constantly improved to keep up with the demand.

A DNS clustering system, which was recently added, has improved performance and made the system even easier to use. Because an administrator will most likely be managing multiple servers, WHM will continue to monitor the server and will notify the administrator of any problems that may affect the server's reliability via email, instant messaging, or text message. This simple notification will allow the administrator to perform preventative maintenance on the server. WHM's security center makes it simple to configure security settings. It also includes virus protection, rootkit detection, and a slew of other security tools. WHM can self-update to keep up with the latest technology and security fixes, keeping your server fully protected.

If you are an administrator who is required to travel frequently, you will appreciate the ability to manage cPanel and WHM from your smartphone. When you access the software from a mobile device, it will automatically display a mobile-friendly interface. There is also Blackberry FastMail support, which will send you emails on your BlackBerry instantly.

The white-label reseller accounts are a feature that resellers adore. This feature is available in both cPanel and WHM, allowing resellers to replace the cPanel logo with their own and brand themselves.

With all of these features and ease of use, it's no surprise that cPanel Web Hosting has the upper hand in the entire web community. All of the features described above make managing a server or a website a breeze. So, when it comes to selecting a control panel, there should be no doubt in your mind.

As you can see, a cPanel control panel will greatly assist you in creating the website you desire with a great deal of flexibility. If you want to make money with it, you'll need more than just a hosting account. As with cPanel, having all of the tools you need in one place would make things so much easier.
