Maybe I have the money, but I'm too shy to buy it as a beginner. Maybe you are also like me. The reasons are because they want to develop first, then order to pay. Because everything is from the intention. It could be that the results start with paying but have no intention of working on your blog. So you don't have to spend money at the beginning.

I made this for free which maybe you can follow too. No need to hire someone to take care of it. Even the method is relatively fast as long as you intend to spend an hour to two hours more or less. Even though all hosting has its pluses and minuses, especially the free ones.

<https://app.infinityfree.net/login>

Like using paid pages, rarely server down, there are 400 MySQL databases, SSL certificate security, free subdomains, PHP 7.3. But if you want to be custom, you can, once you feel it's suitable and the blog grows. Some web experts also recommend this type. So there's nothing wrong if I try.

Immediately, I'll tell you how I've tried it. Create an account at Infinity, create a name/email and password. Then check your email for verification by clicking the link sent. Later you will be redirected to the account button, where you will create a new hosting account. Well, you fill it

Image 1, see this photo

From step 1, you need to fill in the domain address. You can type the domain name as you like. You can choose the domain extension .rf.gd. Click on the subdomain because if you click on a custom domain for those who pay. Then after entering the domain name as you like, type search domain to make sure that your domain has not been used by anyone. Until your domain information is available.

Image 2, see this photo

Next Step 2, fill in the selected domain name in the account label and password column, then click create account.

Image 3, see this photo

Step 3, you will be taken to this page. Wait 5 minutes, then refresh the page until the information in the account details about your account status is active. Yeay! Finally,

Image 5, see this photo

Clicks control panel, and will be redirected to a page of many tools. Scroll down and look for Softaculous Apps Installer. Then the WordPress icon appears and clicks Install. Fill in the Site Settings and Admin Account information then submit. Wait for a few minutes.

When finished, your blog will appear. But this hosting has not set up SSL. So the next step, I installed SSL. So go to the infinity homepage, where there is a button that says Free SSL Certificate, then add your SSL domain, your finished web address. For example, if your address is <https://happisya.rf.gd/>, you can simply write happisya.rf.gd then add the domain. So step 1 you set the provider by selecting the Go Get SSL type by scrolling down and adding then creating an account. Step 1 has been a success. Continue request. Certificate. Later there will be a record name and destination that you will copy. (Don't close this page)

Return to the control panel page by clicking dns. And CName Records. Then paste the record name and destination that you copied. Then returning to the certificate page, you can wait up to 15 minutes until the private key and certificate information appears. You will copy and paste these two columns one by one on the control panel page under the SSL/TLS button. Then click configure. Later you fill in the private key and certificate fields one by one, click upload on the side button. Finished!

Please check your website address. If the page cannot be accessed, wait up to 15 minutes more or less. If you can. Try opening your wordpress admin account. There you can set up a plug in for yoast SEO free!

You can immediately use it by starting to write content. But so that the facilities are more complete. I tried scrolling to the plug in button and typing yoast and install. After that, I clicked on the webmaster in the Yoast description. Set the verification settings by opening the Google console. After that you will be asked to enter your blog URL and continue.

Image 13, see this photo

After that a verification appears which contains an HTML tag, you copy it. Go to the Yoast button and paste the HTML Tag link. Save!

So I'm excited to write new content with active SEO detection. Please, you guys try! You can also

explore various tools in the plug-in menu. It's also good for supporting the quality of your writing. For SEO detection, actually not only Yoast, but there is Rank Math/All in One. Back again to what your needs are like. Because all of these have different facilities, although not much different.

Some opinions on Quora, many use. But if from the start you can manage your website well. There is nothing wrong with using a paid page later. Determine that there will be far more facilities that I will get. That's my experience which might be useful for you to try as a beginner. Even influencers say it doesn't matter if beginners try to start a free website. You can also take advantage of many community networks to share your blog address. So more and more people will know and support you. Discord community, forums Wordpress can be a reference. There you can learn many things until you reach an expert. So that you develop your blog well and make it a money field for businesses with a paid system. You can also subscribe to Infinity or find other hosting with more complete facilities.

Let you be more enthusiastic to live it all. Here I'll tell you about tips for beginners in developing websites. In your blog there are many tools that you can use. Design as attractive as possible so that readers do not get bored reading. From the combination of colors, symbols, layout neatness. Also writing is not only writing but also pictures and graphics.

Good SEO also matters. Expand promotions on social media, you can also ask influencers to help develop your blog. You can also take advantage of social bookmarking, from your country to international. More important is being consistent in creating content. Google prefers specific content over general, so master one field first. So you will get loyal readers if the content you create is more specific. Of course, readers will look for websites that are detailed, updated, and interesting. Once you can find a circle of people who like your website, you can also create a community within it. So what are you waiting for to start making it? Just try it first! Over time we will learn and improve any deficiencies while still increasing the strengths. Good luck!
